# Introduction

- Project-based learning (PBL) is crucial in computing
- Predicting project quality during learning processes
  - inform adaptive modules
  - insights on effective student collaboration

This study: predict the quality of student chatbot projects in an collaborative, AI learning context

# Research Questions

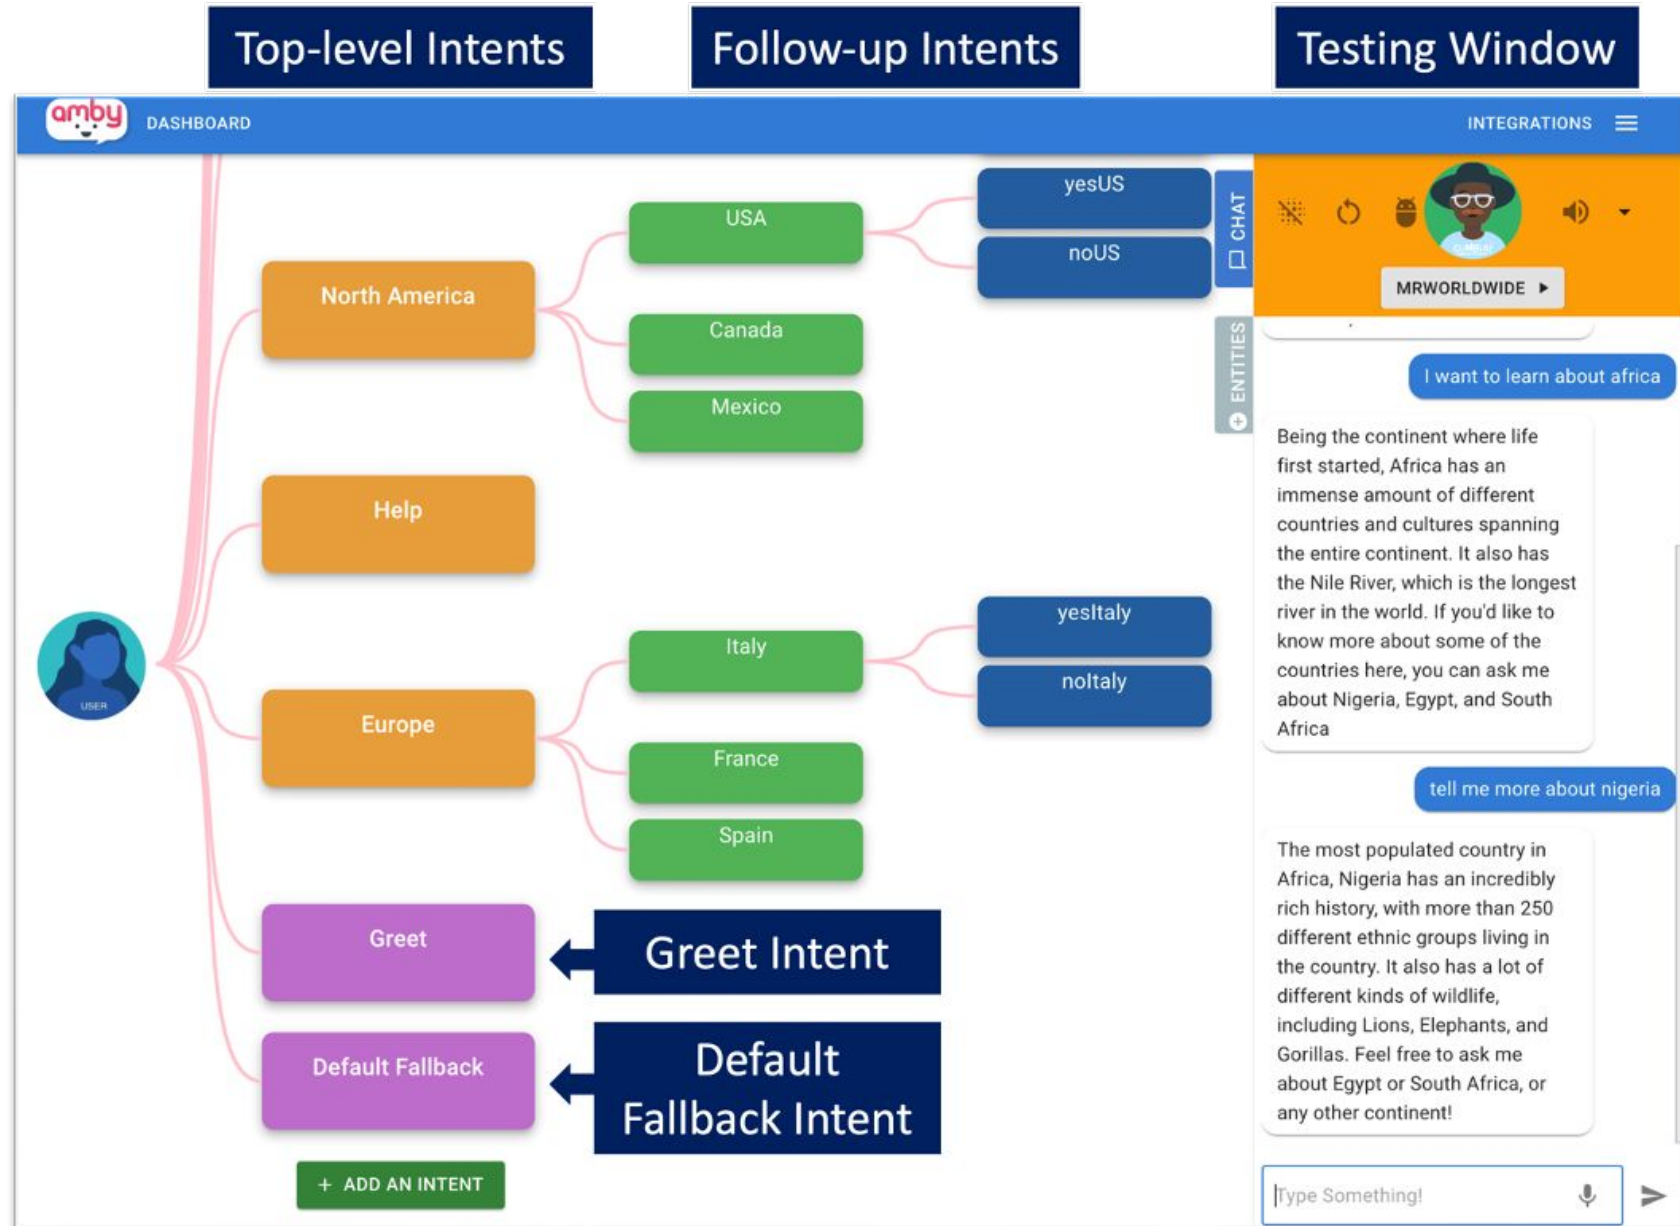

- RQ1: How well can student project quality be predicted from single modalities (dialogue, log data)?
- RQ2: To what extent does the multimodal fusion of these data sources enhance predictive accuracy?

# Context: Pair Programming on AI Chatbots

- Middle school students (average age 11.7 years) in science class
- Pair Programming for chatbots over three 40-min class sessions
- 47 student pairs (94 individuals)

# Learning Platform: AMBY

## Training Phrases

STACKED SIDE BY SIDE **Impact on Oceans** ✕

< Training Phrases

Example sentences for the agent to understand the user's intent. At least 3 training phrases required.

Can you explain the impact of climate change on the oceans

Does climate impact the oceans?

How does it impact the sea?

What are some potential impacts on Oceans?

TRAIN THE AI >

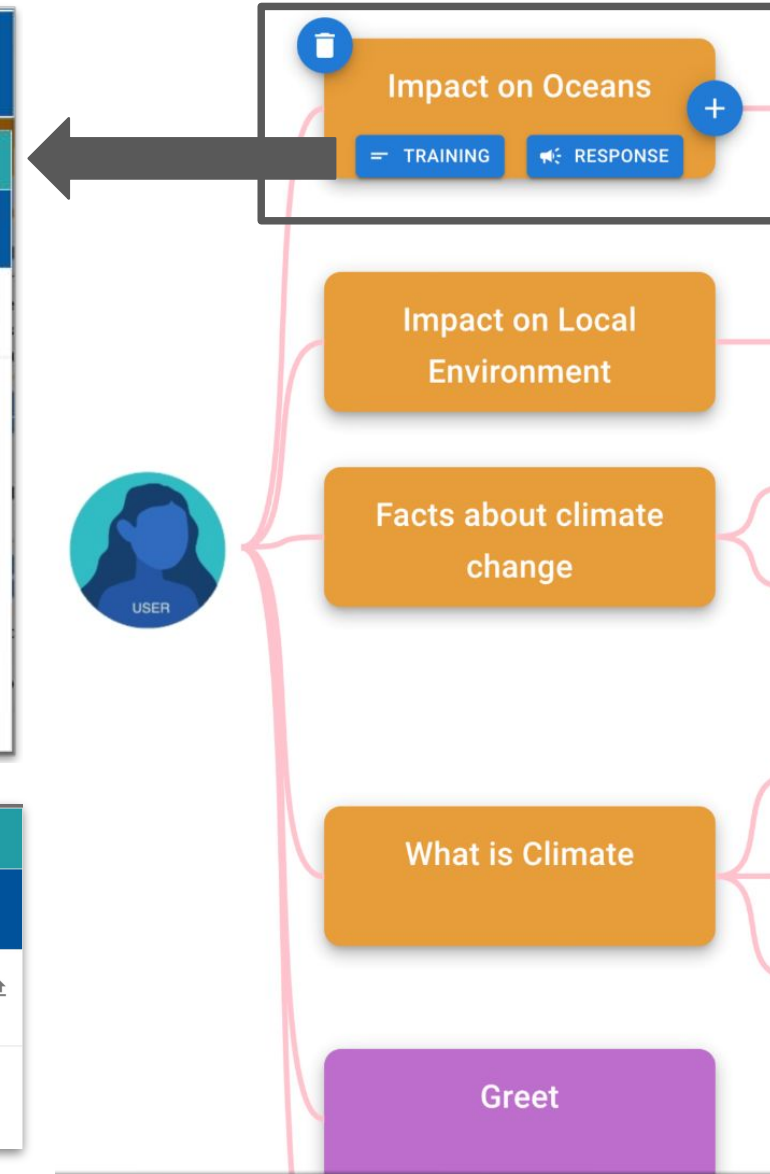

## Responses

< Responses

A list of response that the agent will select from the intent, Impact on Oceans. At least 1 response required.

There are many impact on oceans, including melted ice, increased sea level and ocean acidification.

## Intents

# Dataset

## Dialogue data:

- 121 30-minute collaboration sessions
- Human-transcribed
- Each session contains an average of 278 utterances (SD = 108.7)

## Log data:

- 23 types of timestamped user interaction logs
- Average of 7 intent training requests per session

**Dataset**

dia = Student dialog  
log = System log actions

*S2 controlling computer, S1 suggesting*

dia S1: You forgot to press add.  
log 'add-training-phrase'  
log 'add-training-phrase'  
dia S2: Yeah, in case it doesn't know what a hydrosphere is.  
log 'add-training-phrase'  
log 'add-training-phrase'  
dia S1: And train.  
log 'train-button-click'

# Outcome (Project Quality) Measures

- **Training Phrase Count (productivity)**: number of phrases input by students for training the chatbot
- **Lexical Density (content richness)**: the proportion of content words (nouns, adjectives, verbs, and adverbs) to total words
- **Lexical Variation**: the ratio of unique content words to total content word

Justification of these measures:

- Alignment with key AI learning objectives
- Learning curve analyses
- Correlations with final project grades

# Data Wrangling and Segmentation

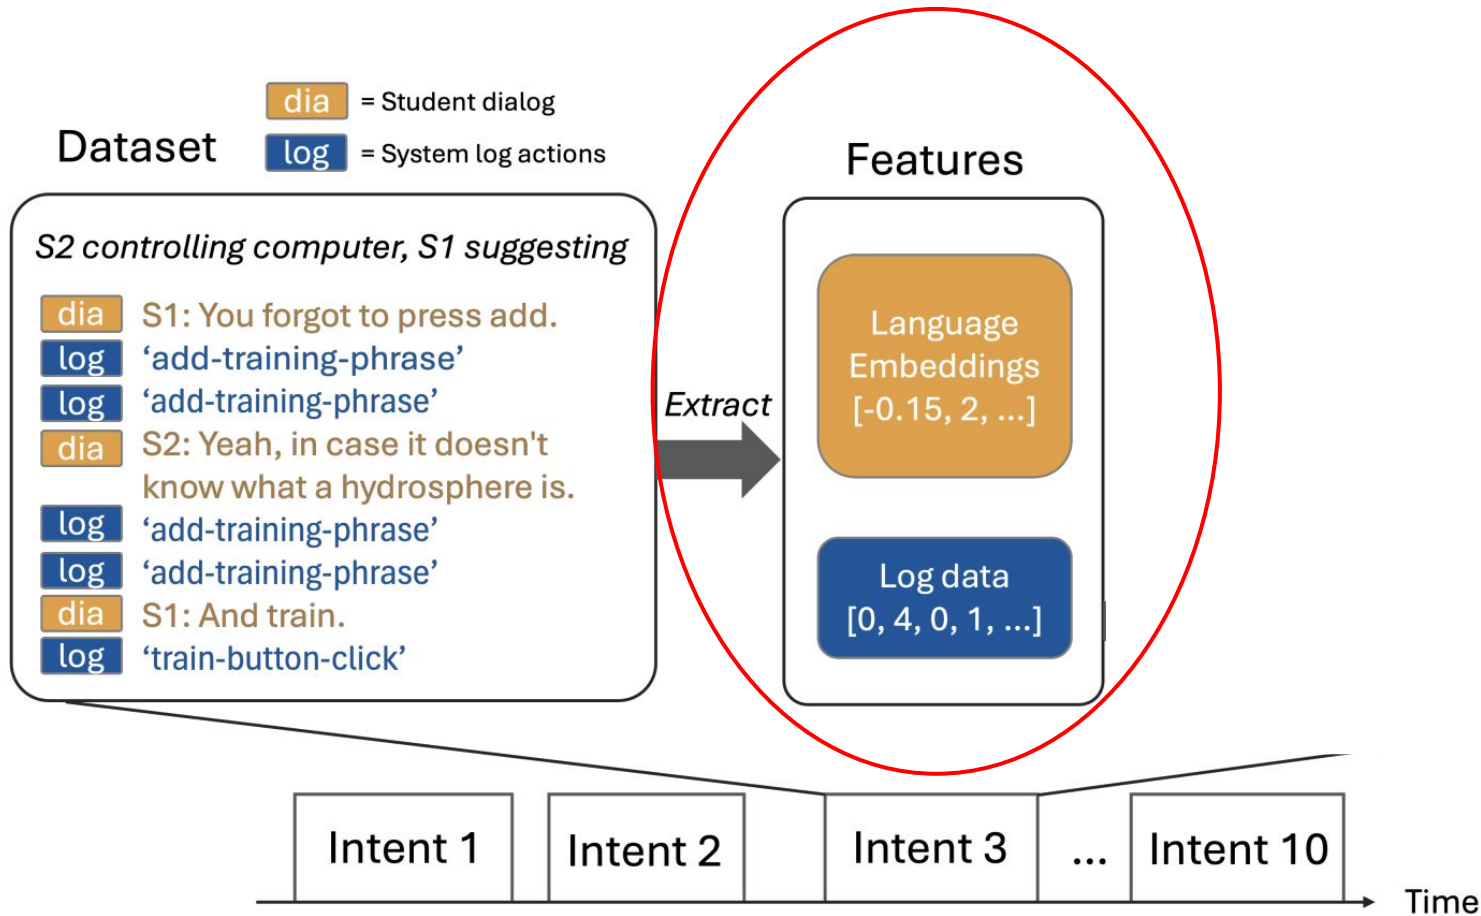

Dataset dia = Student dialog  
log = System log actions

*S2 controlling computer, S1 suggesting*

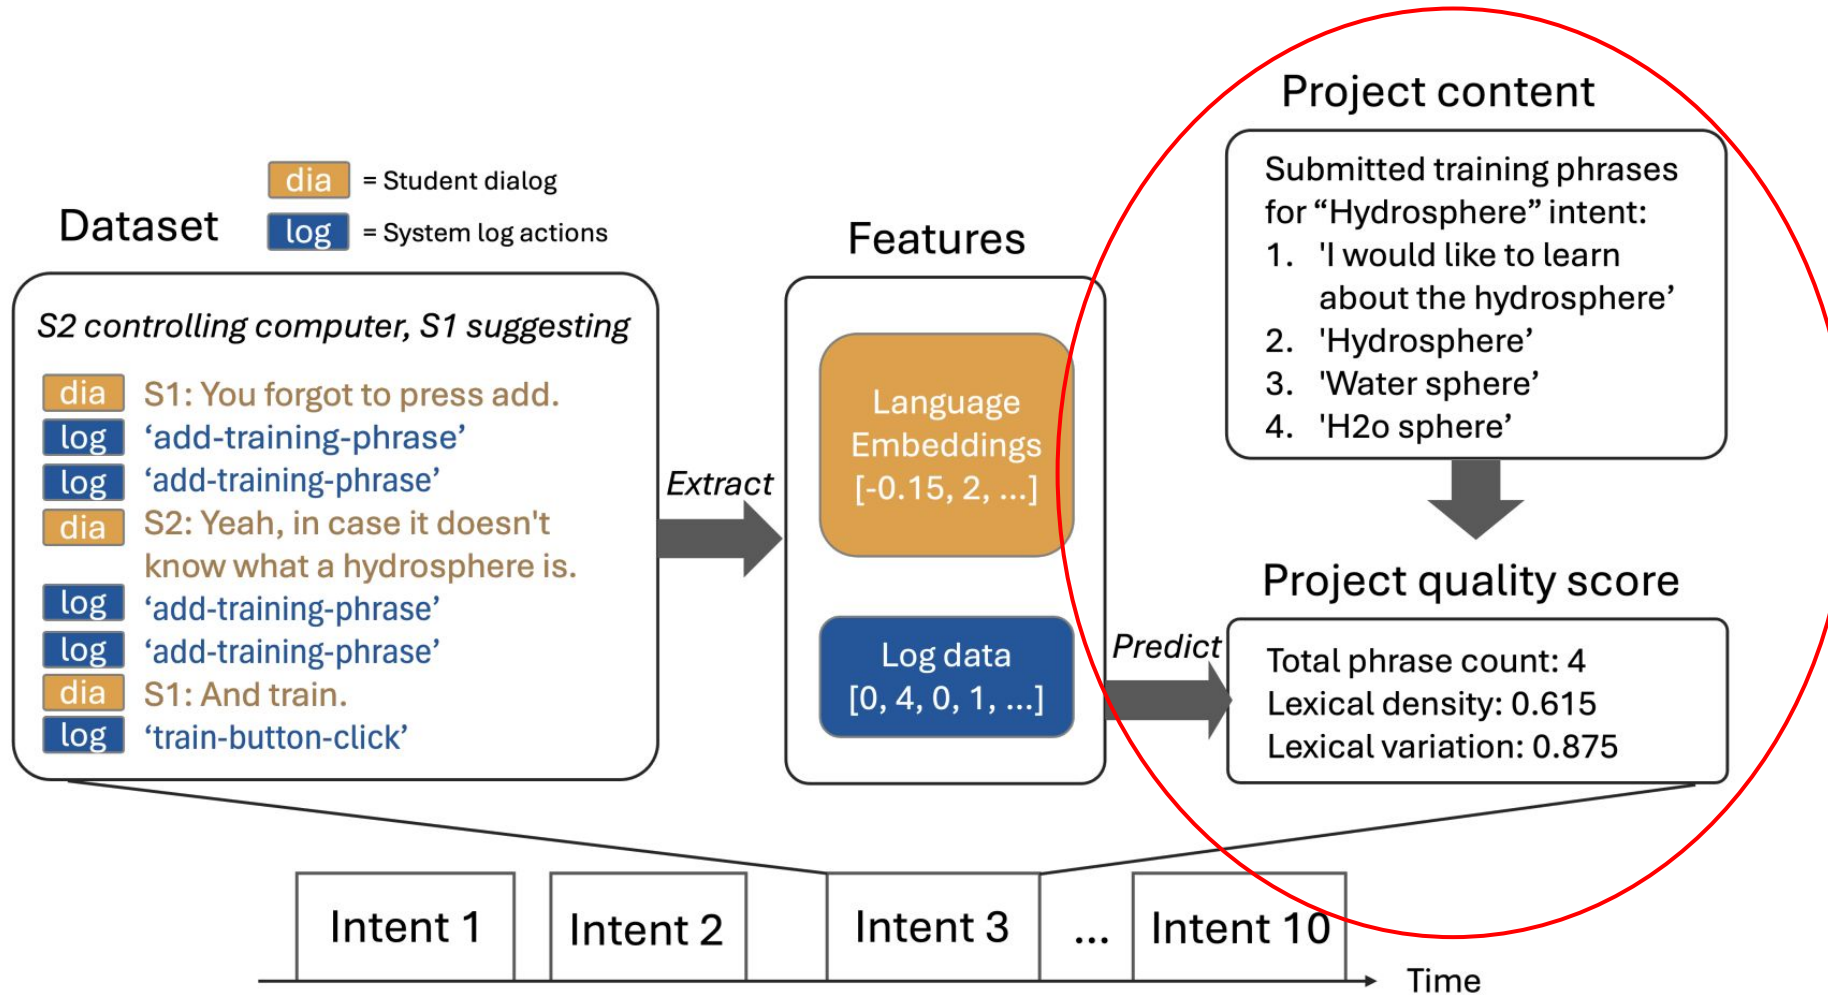

dia S1: You forgot to press add.  
log 'add-training-phrase'  
log 'add-training-phrase'  
dia S2: Yeah, in case it doesn't  
know what a hydrosphere is.  
log 'add-training-phrase'  
log 'add-training-phrase'  
dia S1: And train.  
log 'train-button-click'

# Data Wrangling and Segmentation

# Data Wrangling and Segmentation

# Machine Learning

## Goal:

Predict project quality metrics (productivity, content richness, lexical variation) from **dialogue** and **log data** *together and in isolation*.

# Machine Learning

## Goal:

Predict project quality metrics (productivity, content richness, lexical variation) from **dialogue** and **log data** *together and in isolation*.

## Model Architecture

- Feedforward neural network (2-4 hidden layers; CV-tuned)  
ReLU activation, dropout regularization (0-50%; CV-tuned)
- Optimized with **Adam** and early stopping (patience: 2 epochs)

# Machine Learning

## Goal:

Predict project quality metrics (productivity, content richness, lexical variation) from **dialogue** and **log data** *together and in isolation*.

## Model Architecture

- Feedforward neural network (2-4 hidden layers; CV-tuned)  
ReLU activation, dropout regularization (0-50%; CV-tuned)
- Optimized with **Adam** and early stopping (patience: 2 epochs)

## Evaluation Method

- 5-fold **student-level cross-validation**
- Tested on **33% held-out** set
- Performance metric: **AUC (median split)** with **95% bootstrapped confidence intervals**

# Results

- RQ1: How well can student project quality be predicted from single modalities (dialogue, log data)?
- RQ2: To what extent does the multimodal fusion of these data sources enhance predictive accuracy?

# Results: Unimodal Models

Outcome	Log Only AUC [95% CI]	Dialogue Only AUC [95% CI]
Training Phrase Count	<b>0.8053 [0.7470, 0.8604]*</b>	0.5971 [0.5250, 0.6671]
Lexical Density	0.5112 [0.4556, 0.5655]	<b>0.6551 [0.5920, 0.7168]</b>
Lexical Variation	<b>0.6016 [0.5418, 0.6615]</b>	0.5260 [0.4579, 0.5933]

\*0.6865 when excluding training-phrase setup transactions

# Results: Unimodal Models

Outcome	Log Only AUC [95% CI]	Dialogue Only AUC [95% CI]
Training Phrase Count	<b>0.8053 [0.7470, 0.8604]*</b>	0.5971 [0.5250, 0.6671]
Lexical Density	0.5112 [0.4556, 0.5655]	<b>0.6551 [0.5920, 0.7168]</b>
Lexical Variation	<b>0.6016 [0.5418, 0.6615]</b>	0.5260 [0.4579, 0.5933]

\*0.6865 when excluding training-phrase setup transactions

# Results

- RQ1: How well can student project quality be predicted from single modalities (dialogue, log data)?
- RQ2: To what extent does the multimodal fusion of these data sources enhance predictive accuracy?

# Results: Multimodal Models

Outcome	Best Unimodal	Multimodal
Training Phrase Count	0.8053 [0.7470, 0.8604] (Log)	0.8301 [0.7732, 0.8822]
Lexical Density	0.6551 [0.5920, 0.7168] (Dialogue)	0.5700 [0.5042, 0.6352]
Lexical Variation	0.6016 [0.5418, 0.6615] (Log)	0.6089 [0.5438, 0.6727]

# Discussion of Main Results

## **Log Data** best predicts **productivity**

- “Actions per minute” have shown similar insights into collaboration quality (Borchers et al., 2024)
- Upside: Easy-to-generate proxies
- Downside: Limited insight into what students do differently (there could be many confounds)

# Discussion of Main Results

**Differences between lexical variation (log data best) and lexical density (dialogue data best)**

→ Both lexical variation and training phrase count might reflect distinct dimensions of productivity

→ *Surprising: Both measures are virtually uncorrelated*  
( $\text{abs}(r) < 0.03$ )

# Key Takeaway

- **Predictive value of modality *depends on the outcome being predicted***
- **Increasing evidence that the value of multimodal fusion in education depends on label, features, architecture, hyperparameter, and other modeling choices**
  - See, for instance, Wong et al., 2025; AIED 2025 best-paper nominated!

# Looking Ahead and Applications in CS-EDU

## Future Directions

- **Interpretability:** Apply SHAP or attention visualization to uncover **which features matter** most for each quality dimension.
- **Granularity:** Model individual student contributions and dialogue roles to better understand **collaborative dynamics**.
- **Real-time Adaptation:** Move toward **in-situ feedback**; flag low-quality input or disengagement during chatbot design sessions.
  - a. *N.B.: Transcripts in this study were human-generated, though automated transcription might be feasible..*

# Looking Ahead and Applications in CS-EDU

## Broader Applications

- **K-12 AI Literacy Tools:** Inform design of tools like AMBY to better scaffold **productive collaboration** and **linguistic diversity**.
- **Teacher Dashboards:** Provide educators with **process-level indicators** (e.g., engagement, content richness) for **formative assessment**.
- **Assessment Beyond Grades:** Promote **granular assessments** that value student thinking, not just final artifacts.
  - a. *Potentially important in the LLM metacognitive laziness debate (see Fan et al., 2025; Weidlich et al., 2025).*

# Conclusion

## Contribution to CS Education

- Demonstrates the **feasibility of process-level prediction** in open-ended AI learning (with substantial room for improvement)
- Offers a pathway to a **scalable approach** for assessing project quality proxies in collaborative CS environments (e.g., for learning analytics and feedback)
- Echoes recent research highlighting the **prediction task-dependent utility** of multimodal learning analytics.

## Next Steps

- Improve **feature interpretability** and **real-time application**
- Broaden use to **other CS-EDU contexts** (e.g., block-based coding, data science) *including through our open-source code*
